SOW Overview & Introduction

Purpose of Document

The purpose of this document is to present the Statement of Work (SOW) which outlines the SMU Team's roles, tasks, dependencies, and deliverables at a high level for the Internship & Job Matching Web Application. The Web Application will enable the SMU Team to implement an innovative organizational model to serve as an addition to iMasons's existing services, in order to broaden the number of services currently being provided.

The SMU Team is not obligated to provide services described in this SOW unless an order for the service, incorporating the terms of an agreed SOW, has been placed by the customer under a signed governing agreement in place between iMasons and the SMU Team and accepted by the SMU Team. The SMU Team's performance of the Services described herewith is subject to the assumptions, exclusions and other conditions identified in this document.

Business Value

Company is looking to build, test, prototype, and/or deploy this solution to help with xyz which could increase revenue, reduce operating costs, or add value to the community. This solution specifically addresses ABC.

Scope of Project

The SMU Team will work with iMasons to create a web application for users to book and apply for opportunities with the employer of their choice. The accessible application will have the below functionality and features:

1. Login page - iMasons identifiers and credentials.
2. Create profile for students: upload resume, add skills, set location, and set availability/active status.
3. Posting page: post employer job templates and services.
4. Search filter for employers: location, availability, industry.
5. Display logged-in analytics such as student profile views and job posting views.
6. Logout page.

Out of Scope

Anything that was not mentioned in the Scope of Project is considered out of scope. Examples of out-of-scope activities include the following:

- Providing services to non-current iMasons registered members without identifiers.
- In-system messaging or application submissions (all outreach is handled externally).
- Providing background checks on customers or students.
- Implementation of the aspirational AI Assistant (exploratory / future phase).
- Installation and troubleshooting of third-party software agents, including antivirus and backup software.

Services Rendered

The services defined in this SOW attend to the fundamental functional areas where the SMU Team can add value to iMasons's web application service. The solution will be delivered using a hybrid Agile and Waterfall Software Delivery Life Cycle (SDLC). The key service categories that will be implemented are as follow:

Service Category: Program Management
Object and Value:

The SMU Team provides program management which will take care of all the activities assigned to the team that agreed by iMasons in order to make sure that everything is done with quality and within time and budget.

The SMU Team's Program Manager is responsible for supporting iMasons to deliver this SOW.

Key Deliverables:

- Tracking project milestones and deliverables, from both the SMU Team and iMasons.
- Providing plans for issues related to schedule, risk, actions, and decisions.
- Schedules defining tasks, durations, and deliverable milestone dates.
- Bi-weekly status reports that provide high-level summary on this project.

Service Category: Software Engineering
Objective and Value:

The SMU Team will provide an end-to-end software engineering lifecycle solution starting with requirements gathering, software design, software development and testing, deployment, and the final transition to iMasons. The process begins with Requirements Engineering to define the technical characteristics of the solution. The SMU Team will provide a technical deep dive session with iMasons to present an overview of the functional and non-functional requirements needed to meet the project scope, followed by weekly meetings on Tuesdays to finalize the requirements document. During this phase, requirements are broken down into Features and User Stories, and initial User Interface (UI) mock-ups referred to as wireframes will be created and modified through three iterations before finalizing.

The output of the requirements phase will lead to features and user stories spread across Sprints for implementation. Concurrent with this, Architectural Design will be used to define the technical characteristics of the solution. The SMU Team will provide a technical deep dive session to present an overview of the design, explaining the services and user interface to iMasons, with subsequent weekly meetings to guide the client toward a complete design agreement. The SMU Team will utilize its practices and experience to provide design documentation, including hardware, software, and connectivity details, to ensure requirements can be delivered. The output will be a context or high-level diagram; however, if this already exists within the company, no additional work is required.

Implementation and Testing involves the code development, unit testing, and system integration for the project. Implementation will be executed using Agile Development with 15-day deployments to either a production or testing environment, with defect fixing and coding continuing throughout the duration of the project.

Deliverables:

The SMU Team will create a Software Engineering Document (SED) containing required life cycle details, which will be delivered to the customer at the end of each checkpoint.

Service Category: Transition / Handover
Objectives and Value:

The objective of this service is to provide transition information and a formal handover to iMasons, which will be used to help the client transfer the project from the student team to an internal development organization. The key deliverable is the Software Engineering Document, which provides an end-to-end record of the project from requirements to deployment. The transition will also identify future enhancements, code location, and other key items needed for iMasons to update and maintain the solution.

Deliverables:
The SMU Team will update the software engineering document (SED) with the required transition and handover plans.

CUSTOMER Responsibilities

The scope and realizations defined in the Services Section are contingent upon the ensuing customer responsibilities . iMasons must arrange to have personnel attend all meetings essential to adhering to full regulatory compliance required for operations and must provide a Single Point of Contact (SPOC) . iMasons is responsible for providing all project resources and security access necessary to fulfill the Scope of Project, including access to any Cloud Services and development, testing, and production environments where required.

While the SMU Team will be responsible for the operations, services, and performance of the products provided, the team is not responsible for those provided and maintained by third-party contractors. Finally, iMasons is responsible for all user activity associated with the application after the SMU Team's delivery.

Acceptance Criteria

The SMU Team will provide iMasons a work product for review and verbal and/or email acceptance.

Agreement

This SOW and the terms and conditions of the Agreement constitute the entire agreement between iMasons and the SMU Team and supersede all prior oral or written negotiations and agreements regarding the subject matter herein. Any modification or addition to this SOW shall be in writing and signed by authorized representatives of both parties. IN WITNESS WHEREOF, the parties hereto have caused this SOW to be executed by their duly authorized representatives
